

In Brief

- The Gateway Active Index-Option Overwrite Composite (the Composite) returned -10.44%, net of fees, in the second quarter compared to the -10.92% and -16.10% return of the Cboe® S&P 500 BuyWriteSM Indexⁱ (the BXMSM) and the S&P 500® Index, respectively. (A GIPS® Composite Report is included with this Commentary.)
- Record-high inflation persisted, accelerating the Federal’s Reserve’s monetary tightening schedule while souring investor sentiment, resulting in a 19.69% decline for the S&P 500® Index from April 4 to June 16, officially entering a bear market. From its 2022 peak on January 3 through its new year-to-date low on June 16, the S&P 500® Index declined 22.99%.
- With monthly net returns of -5.76%, 0.25% and -5.20% for April, May and June, respectively, most of the Composite’s outperformance relative to the BXMSM was the result of outperformance in May.
- Implied volatility, as measured by the Cboe® Volatility Index (the VIX®), averaged 27.40 in the second quarter of 2022. In a reversal of its normal relationship, average implied volatility was lower than realized volatility, as measured by the standard deviation of daily returns for the quarter. The VIX® opened the quarter at 19.63 before reaching its intra-quarter low of 18.57 on April 4. The VIX® climbed to an intra-quarter high of 34.75 on May 9, then closed the quarter at 28.71.
- The S&P 500® Index, the BXMSM and the Composite* had an annualized standard deviation of daily returns of 28.32%, 20.77% and 21.68% for the second quarter, respectively.
- As the equity market declined throughout the quarter, adjustments to the written index call option portfolio focused on lowering the weighted-average strike price to maintain market exposure that is consistent with the Composite’s typical profile while taking advantage of elevated implied volatility to enhance cash flow potential.
- “When the VIX® is high, it’s time to buy. When the VIX® is low, look out below.” After the S&P 500® Index’s worst first six months of a year in more than five decades, the VIX® is well-above average and investors may be increasingly fearful. Should investors be taking their cues from snappy adages? Gateway believes strategies combining equity market exposure with cash flow from selling index options can help investors stay focused on the long-term by softening the impact of market direction over the short-term.

Q2 2022 Market Path & Implied Volatility

Source: Bloomberg, L.P. *The portfolio performance and standard deviation reflected for the Composite are those measured by a representative account. This information represents supplemental information to the GIPS® Composite Report. This representative account was selected as it is the largest account in the Composite.

Market Recap

The S&P 500[®] Index returned -16.10% for the second quarter of 2022, bringing its year-to-date return to -19.96%. There were few silver linings during the quarter as the S&P 500[®] Index posted monthly returns of -8.72%, 0.18% and -8.25% in April, May and June, respectively. Record-high inflation persisted, accelerating the Federal's Reserve's monetary tightening schedule and souring investor sentiment, resulting in a 19.69% decline for the S&P 500[®] Index from April 4 to June 16, at which point the market officially entered a bear market. From its 2022 peak on January 3 through its new year-to-date low on June 16, the S&P 500[®] Index declined 22.99%.

U.S. macroeconomic data released in June reflected a difficult macroeconomic environment. The third estimate of Gross Domestic Product for the first quarter of 2022 showed that the U.S. contracted by an annualized rate of 1.6%, slightly worse than the consensus expectation of a 1.4% contraction for the quarter. The unemployment rate was slightly higher than the consensus estimate, holding steady at 3.6% from April to May, while the participation rate ticked up to 62.3%. The May Consumer Price Index, released June 10, continued its record-breaking streak with a year-over-year increase of 8.6%, which was its highest reading for 2022 and above the consensus expectation. First quarter aggregate operating earnings were on track to climb just 0.9% quarter-over-quarter while increasing nearly 40% year-over-year. With over 99% of companies reporting, nearly 80% met or exceeded analyst estimates.

Implied volatility, as measured by the VIX[®], averaged 27.40 in second quarter of 2022. With half of the days in the second quarter featuring S&P 500[®] Index moves of 1% or greater, including a 4.02% plunge on May 18 and a 3.06% rally on June 24, realized volatility reached 28.32% for the quarter - as measured by the standard deviation of daily returns for the S&P 500[®] Index - the highest reading since the second quarter of 2020. The implied volatility response to the large daily moves was relatively muted resulting in second quarter realized volatility exceeding implied volatility for the first time since the first quarter of 2020. The VIX[®] opened the quarter at 19.63, near its intra-month low of 18.57 on June 4, then climbed to an intra-quarter high of 34.75 on May 9. The VIX[®] ended the quarter at 28.71.

The BXMSM returned -10.92% in second quarter of 2022, outperforming the S&P 500[®] Index by 518 bps and bringing its year-to-date return to -10.19%. With monthly returns of -4.72%, -3.73% and -2.88%, outperformance relative to the S&P 500[®] Index in April and June eclipsed underperformance in May. The BXMSM also provided 640 bps of downside risk mitigation relative to the S&P 500[®] Index during its drawdown from April 4 through June 16 with a return of -13.29. On the third Friday of each month, the BXMSM writes a new index call option as the option it wrote the previous month expires. The premiums the BXMSM collects on its written index call options have significant influence on its return potential during market advances and help to mitigate market declines. The well-above-average implied volatility throughout the quarter was reflected in the relatively high premiums collected in the second quarter. The premiums the BXMSM collected as a percentage of the BXM'sSM underlying value were 2.09%, 2.53% and 3.32% in April, May and June, respectively. While the premiums collected by the BXMSM during the quarter provided consistent downside protection, the timing of the replacement of its written option in May limited its participation in the equity market's brief month-end rally, resulting in underperformance for the month. From the beginning of the month through May 19, the day prior to the expiration of its written call option, the BXMSM returned -5.24%, while the S&P 500[®] Index returned -5.47%. On May 20, the BXMSM wrote a new index call option with a June expiration and a portion of the premium it received contributed to the return of the BXMSM over the remainder of the month, but it was insufficient to keep pace with the advance of the equity market. The BXMSM returned 1.59% from its closing value on May 19 through month-end, while the S&P 500[®] Index rallied 5.98% over the same period.

The Agg returned -4.69% in the second quarter, its second consecutive quarterly decline, bringing its year-to-date return to -10.35%. The yield on the 10-year U.S. Treasury Note (the 10-year) started the quarter at its intra-quarter low of 2.38% then rose to an intra-quarter high of 3.47% on June 14, at which time the yield curve was slightly inverted. The 10-year ended the quarter with a yield of 3.01%.

Gateway Active-Index Option Overwrite Composite Performance

The Composite returned -10.44%, net of fees, in the second quarter, outperforming the BXMSM by 48 bps, bringing its year-to-date return to -13.50% relative to the BXMSM year-to-date return of -10.19%. With monthly net returns of -5.76%, 0.25% and -5.20% in April, May and June, respectively, the Composite's outperformance relative to the BXMSM in May more than compensated for underperformance in April and June. The Composite provided loss mitigation and outperformed the S&P 500[®] Index throughout the quarter.

The portfolio performance contributions, annualized standard deviation and portfolio statistics quoted for the Composite in the following paragraphs are those measured by a representative account.ⁱⁱ

Most of the Composite’s outperformance versus the BXMSM came during the brief equity market advance during the end of May. The Composite’s active and diversified approach resulted in a typical amount of market exposure over the course of the market advance while the rules-based timing of the BXMSM’s replacement of its single written index call contract resulted in the BXMSM having less exposure to the market than usual. Specifically, the Composite returned 3.95% from May 19 through May 31 relative to the 1.59% return of the BXMSM.

The Composite’s underlying equity portfolio returned -15.80% in the second quarter, a positive performance differential of 30 bps relative to the S&P 500[®] Index. Index call option writing contributed positively to performance throughout the quarter, providing risk-reducing cash flow and generating gains during each month of the quarter. In achieving its low-volatility objective, the Composite’s annualized standard deviation of daily returns for the quarter was 21.68% compared to 28.32% and 20.77% for the S&P 500[®] Index and the BXMSM, respectively. The Composite exhibited a beta to the S&P 500[®] Index of 0.76 for the quarter.

As the equity market declined throughout the quarter, adjustments to the written index call option portfolio focused on lowering the weighted-average strike price to maintain market exposure that is consistent with the Composite’s typical profile while taking advantage of elevated implied volatility to enhance cash flow potential. As the market advanced during the end of the quarter, the investment team was patient in adjusting index call option contracts. Select contracts were traded in advance of their expiration dates and exchanged for ones with higher strike prices and later expiration dates. These adjustments and above-average premiums allowed for attractive participation in the market’s advance at quarter-end.

At the end of the quarter, index call options were sold against over 95% of the equity portfolio’s value with a weighted average strike price greater than 2.5% out-of-the-money, 26 days to expiration and annualized premium to earn between 15.0% and 20.0%. Relative to the beginning of the quarter, this positioning represented greater net cash flow potential and higher market exposure.

Market Perspective – A New Era?

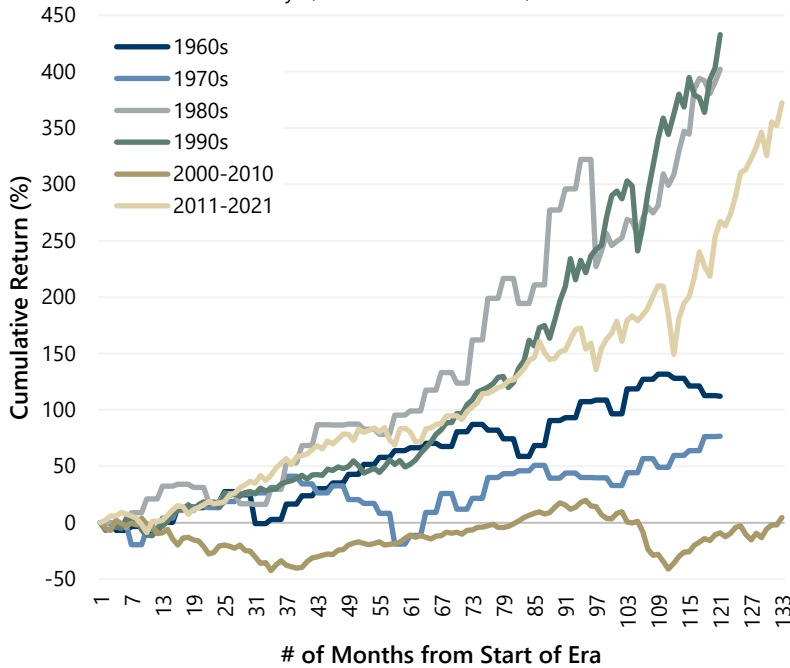

Wall Street has no shortage of adages and catch phrases. When the equity market hits the skids, old saws such as “be fearful when others are greedy and be greedy when others are fearful” encourage investors to be contrarian and seek opportunity where others find misfortune. There is an analogous saying associated with the VIX[®] that appeals to those who prefer cliches that rhyme: “When the VIX[®] is high, it’s time to buy. When the VIX[®] is low, look out below.” While these sayings are catchy and contain a modicum of insight on how some experienced investors tend to navigate the markets, they fall short of being effective signals for precisely when to buy and sell stocks.

For example, from mid-2012 through 2017 the VIX[®] was persistently low, rarely rising above its long-term average. Not only were equity market returns well-above average over this period, but the S&P 500[®] Index only had one drawdown that exceeded 10% - a 12.04% loss that lasted less than five weeks in the summer of 2015. Conversely, the VIX[®] was persistently above-average from the late 1990s into the early 2000s, a period that witnessed a S&P 500[®] Index drawdown of over 47% from September 2000 into October 2002. Additionally, if above-average market returns or above-average market valuations are signs that investors are “greedy,” those heeding the adage coined by Warren Buffet would have spent almost the entire decade of the 2010’s too fearful to enter the equity market and missing out on well-above-average returns.

After the worst first six months of a year in more than five decades, many investors are fearful, and the VIX[®] is well-above average. Should investors be taking their cues from snappy sayings? Long-term investors who want to avoid the anxiety of being “all in” or “all out” may benefit from low volatility equity strategies that combine equity market exposure with cash flow from selling index options. Such strategies can help investors stay focused on the long-term by softening the impact of market direction over the short-term.

Figure 1: S&P 500® Index Cumulative Return by Era

January 1, 1960 to December 31, 2021

All eras begin on January 1 of the first year in the period and end on December 31 of the last year in each period. Source: Morningstar DirectSM.

While market pullbacks and volatility spikes in recent years have proven to be opportunities to buy into an equity market that would soon resume its rapid advance, Figure 1 illustrates that the market has had extended eras when downside volatility was not a harbinger of immediate upside opportunity. What can long-term investors do to prepare for the possibility that the next era is different than the last several years?

As the table in Figure 2 shows, investors with strategic allocations to stocks and bonds have earned similar returns to the equity market in each era, but with lower risk. In eras since the 1990s, option writing indexes such as the BXMSM and the Cboe® S&P 500 PutWrite Index (the PUTSM) delivered similar returns to a balanced allocation while also exhibiting lower risk than the equity market. Also note that stocks and bonds have both had extended eras of very low returns, with bonds generating an annualized return of just 1.45% in the 1960s and stocks producing less than 1% annualized from 2000 through 2010. A worst-case scenario for balanced allocation investors would be such low returns from both asset classes simultaneously for an extended period of time.

Figure 2: Return and Risk by Era

	1960s		1970s		1980s		1990s		2000-2010		2011-2021	
	Return (%)	Risk (%)	Return (%)	Risk (%)	Return (%)	Risk (%)	Return (%)	Risk (%)	Return (%)	Risk (%)	Return (%)	Risk (%)
Stocks	7.81	13.54	5.85	18.57	17.51	18.15	18.21	13.43	0.41	16.41	15.16	13.34
Bonds	1.45	5.87	5.52	8.25	12.61	14.19	8.79	8.18	7.91	11.46	6.03	10.19
Balanced Allocation	5.51	8.64	6.25	11.59	16.22	12.92	14.73	9.76	4.10	9.93	11.95	7.41
BXMSM Index							15.94	8.65	2.89	12.20	7.37	9.94
PUTSM Index							16.44	7.36	5.16	12.24	7.93	9.51

Note: Stocks reflect data for the S&P 500® Index. Bonds reflect data for the Ibbotson Long-Term U.S. Government Bond Index. The Balanced Allocation is a blend of 60% Stocks and 40% Bonds rebalanced monthly. All eras begin on January 1 of the first year in the period and end on December 31 of the last year in each period.

Index option-based low volatility equity strategies provide a unique opportunity for investors. The equity market exposure of such strategies can be beneficial when equity market returns are positive, while cash flow from index option selling can mitigate losses when equity market returns are negative. Importantly, the cash flow potential from such strategies tends to increase as equity market volatility rises. Furthermore, rising interest rates do not have a negative impact on cash flow generated by selling index options.

This combination of characteristics makes index option-based low volatility equity strategies a potentially valuable component of diversified portfolios in a wide range of long-term scenarios. If the current bear market is followed by a resumption of above-average equity market returns, in a pattern similar to recent years, index option-based low volatility equity strategies may generate lower returns than the equity market but offer better return potential than bonds, especially if interest rates remain at current levels or rise.

If equity market returns are moderate or flat for an extended period of time, index option writing cash flow is a source of return potential that can help keep pace with or potentially exceed equity market returns. In this scenario, option writing cash flow offers long-term return potential that is attractive relative to bonds if the long-term interest rate trend is rising, flat or declining back toward historic lows.

Finally, if the equity bear market becomes prolonged, index option-based low-volatility equity strategies offer meaningful loss mitigation potential from index option writing cash flows. Mitigating losses preserve capital, potentially allowing for more of the portfolio to participate in the equity market's eventual recovery. In this scenario, bonds may be a better source of capital preservation as the equity market declines but also represent a ballast in the portfolio that potentially has limited participation in the equity market's eventual recovery.

Are inflation and rising interest rates ushering in a new investment era? Or will the market resiliency of recent years continue? It may be too early to make that call. Strategies that combine equity market exposure with cash flow from index options that reduces risk while providing an additional source of potential return may have appeal for diversified, long-term investors who are uncertain about what lies ahead for the asset classes they are exposed to. For nearly 45 years, Gateway has provided access to the unique potential of option strategies, helping investors navigate the ups and downs of both the equity and bond markets.

Important Information

ⁱ The BXMSM is a passive total return index designed to track the performance of a hypothetical buy-write strategy on the S&P 500[®] Index. The construction methodology of the index includes buying an equity portfolio replicating the holdings of the S&P 500[®] Index and selling a single one-month S&P 500[®] Index call option with a strike price approximately at-the-money each month on the Friday of the standard index-option expiration cycle and holding that position until the next expiration.

ⁱⁱ Represents supplemental information to the GIPS[®] Composite Report. This representative account was selected as it is the largest account in the Composite.

Gateway Investment Advisers, LLC (Gateway) is an independent registered adviser and a successor in interest to Gateway Investment Advisers, L.P. as of February 15, 2008. Performance information for Gateway Active Index-Option Overwrite Composite (the Composite) shown in this illustration is an asset-weighted composite of discretionary accounts under Gateway's management which share the same investment objectives and hedging strategies.

The Composite was created on April 1, 2008.

The Composite's net of fee performance results reflect the reinvestment of dividends and other earnings and reflect the deduction of investment advisory fees.

The effectiveness of Gateway's strategy might be reduced if the portfolio doesn't correlate to the performance of the index underlying its option positions. Rebalancing of a portfolio may involve tax consequences.

Selling index call options can reduce the risk of owning stocks, but limits the opportunity to profit from an increase in the market value of stocks in exchange for up-front cash at the time of selling the call option. Unusual market conditions or the lack of a ready market for any particular option at a specific time may reduce the effectiveness of the Composite's option strategy, and for these and other reasons the Composite's option strategy may not reduce the volatility to the extent desired.

Past performance is no guarantee of future results. A more detailed description of Gateway's standardized fees is included in Form ADV, Part 2.

N/A: The gross three-year annualized ex-post standard deviation of the Composite and benchmarks is not presented as 36-month returns are not available. For all periods shown, the Composite has less than six accounts for the full year. As such, the Composite dispersion of portfolio returns is not applicable.

Gateway Active Index-Option Overwrite Composite contains fully discretionary hedged equity accounts that hold common stock and sell index call options on at least 95% of the underlying stock value. Indexes utilized for call option activity are U.S. domestic equity indexes that include all sectors of the economy. This call activity reduces volatility and provides cash flow. The creation and inception date of the Gateway Active Index-Option Overwrite Composite was April 1, 2008.

For comparison purposes the Composite is measured against two indexes, the S&P 500® Index, a popular indicator of the performance of the large capitalization sector of the U. S. stock market, and the Cboe® S&P 500 BuyWriteSM Index (BXMSM Index), a passive total return index designed to track the performance of a hypothetical buy-write strategy on the S&P 500® Index.

Performance results are expressed in U. S. dollars. Returns are presented gross and net of actual management fees and include the reinvestment of all income. Past performance is not indicative of future results. The 3-year standard deviation is calculated using gross returns. Net of fee performance was calculated using actual management fees. The current investment management fee schedule is as follows: 0.85% on the first \$5 million; 0.65% on the next \$5 million; 0.50% on the next \$40 million; and 0.45% on assets in excess of \$50 million. Actual investment management fees incurred by Composite accounts may vary.
